RTD Stream for SAP S/4 HANA

Consolidate All Your ERP Data into a Single S/4 HANA View

SAP Business Suite 4 SAP HANA (SAP S/4 HANA) is a business suite offering available as an on premises or cloud solution for finance organizations. Powered by SAP HANA, it provides real-time controls and insights to CFO's and finance departments so they can better optimize their business in an increasingly more fragment ERP landscape.

RTD Stream enhances SAP S/4 HANA by automating the integration of heterogeneous ERP data (such as general ledger data from Oracle E-Business Suite, JD Edwards or other non-SAP ERP systems), and delivering it into S/4 HANA for a complete financial view of the business. Enabling access to all of the organization's fragmented ERP data allows for finance professionals to centrally control their operations in a true shared services environment.

RTD Stream is an innovative solution that leverages our deep understanding of the internal Oracle ERP's and SAP HANA data structures. Unlike other approaches, RTD Stream automatically extracts, transforms, rationalizes, maps and organizes Oracle ERP systems data (JD Edwards, PeopleSoft, E-Business Suite) then structures and continuously feeds the data into SAP S/4 HANA for a consolidated view.

RTD Stream can be expanded to include RapidDecision, our analytics solution running on SAP HANA to enable additional subject areas beyond general ledger to provide a richer reporting and analytics capability. Twenty-two additional subject areas including AP, AR, Inventory, and Sales are available.

By adding RapidDecision, SAP S/4HANA finance users can query general ledger data and drill down into detailed business transactions. For example, users can link a revenue journal entry to the original sales order. An expense transaction can be associated with the purchase order, receipt or payable. And inventory valuation can be linked to real time inventory balances.

Key Benefits

- Users can easily load non-SAP ERP data into S/4 HANA using pre-configured data flows
- Adding RapidDecision on SAP HANA ensures 100% of the Oracle ERP (JD Edwards, PeopleSoft, E-Business Suite) transaction data is available for analysis enabling users to drill back to source system data. Reports can be enhanced and new analytics created without the typical delays and the effort required to extract additional data elements from source systems.

- All SAP and non-SAP ERP data is available on a single SAP HANA platform.
- Data is continuously updated and remains current - mitigating the need for periodic refreshes that can impact system and network performance.
- ERP version changes that can impact the internal ERP data structure are completely transparent to the reports and analytics.
- RapidDecision is certified by the SAP Center of Excellence for SAP HANA.
- Bundled with starter reports for supported transaction types

In addition, the RTD Stream solution can capture data from other non-Oracle ERP, CRM and custom systems with a Universal Adapter.

With the fastest time to value, lowest risk and lowest total cost of ownership, RTD Stream can be installed in as little as 10 days per ERP source. And with a fixed price guarantee, the implementation eliminates costly surprises.
