

Noetix® Generator for Oracle® Discoverer™

Noetix Generator for Oracle Discoverer delivers automated, cost-effective access to Oracle® E-Business Suite (EBS) data, making it faster and easier to roll out end user reporting to Discoverer users. Noetix Generator for Oracle Discoverer configures Discoverer's End User Layer (EUL) to use NoetixViews®. As a result, report authors and query users can immediately begin using Oracle Discoverer to develop reports and queries against their application data.

Populate Noetix Content into Oracle Discoverer

Generate NoetixViews Content into Discoverer EUL

Normally, to begin using Oracle Discoverer, the EUL must be built, a technically challenging and time-consuming process. Noetix Generator automates the EUL creation process. Noetix's flagship product, NoetixViews, provides an operational BI reporting model for Oracle EBS and PeopleSoft® Enterprise customers. NoetixViews maps thousands of application tables into logical business views that include complex joins and business-friendly terminology. Noetix Generator populates Discoverer business areas with all of the details of NoetixViews.

Real-time Operational Reporting

Noetix Generator enables direct access to the data in the transaction system, providing users with the most complete and up-to-date information.

Configured to Match Your EBS Setup

No two configurations of EBS are the same because NoetixViews automatically picks up customers' individual application configuration options such as key and descriptive flexfields, charts of accounts, operating unit and organization setups, security profiles, and more. As a result, your Noetix generated EUL will reflect the unique aspects of your EBS implementation.

Protects Reports from Oracle Upgrades

Through application upgrades and patches, Oracle often introduces significant changes to application base tables. NoetixViews shields reports and queries from these changes by remapping the views to the new base tables. Noetix Generator keeps the Discoverer business areas synchronized with NoetixViews, preserving the linkage between users' reports and the views.

Intuitive Setup and Administration

The Noetix views are grouped by subject area into roles. These roles generally align with the Oracle EBS applications. Noetix Generator creates a business area for each role, and folders in the business areas for each view in the role thus creating an intuitive organization of the views for users. By granting a Noetix role to a user, administrators control which business areas they can access, thus combining the security administration of NoetixViews and the Discoverer EUL into a single task.

Integration with Oracle E-Business Suite Security

NoetixViews and Noetix Generator for Oracle Discoverer support Applications-mode EULs. When a user runs a report, the Noetix view enforces the data access privileges of the EBS user, thus assuring they see data in Discoverer consistent with the data they access when using EBS. This includes the enforcement of HR security profiles, flexfield security rules, and EBS Release 12 Multi-org Access Control.

View and Column Descriptions

Noetix Generator populates the EUL with the view and column definitions that come with NoetixViews. This ensures all users operate from a common understanding of the purpose and use of each view and its columns.

Predefined Drills

By predefining the drills, Noetix Generator simplifies navigation from one set of information to other related data. Report users can examine summary information and then quickly “drill down” to see the supporting details.

Predefined Joins and View Relationships

Noetix Generator builds the joins between related views, enabling users to build more complex reports that include data from two or more views.

Automatic Population of Lookup Values

Discoverer report authors can add efficient filters to their reports by using specialized Noetix-generated lookup values. With lookup values, users can select from a list of items rather than manually searching for specific values. For example, a user who wants to view all invoices for a specific supplier can select from a list of vendor names.
